

KICK ROLLER FEATURES AND OPERATION

We would like to introduce to you the amazing KICK ROLLER skate shoes which have been accepted with big success in Europe and other parts of the world.

In case you are not familiar, we give you below a small description of the product.

These retractable roller shoes bring you a new fashion in skating with 4 highly durable and high performance wheels (indoor/outdoor) housed in the middle of the sole. The wheels are of PU material anti-quiver, using advanced ABEC-5 bearings for high precision and endurance which are used in all professional roller blades and skates. The structure of the wheels is of stainless steel for safety, durability and accuracy during operation of this high intelligent shoe – roller skate. The shoes are built from advanced, high quality materials such as Microfiber, EVA and flexible and breathable insoles.

One push (kick) button mechanism at the heel, when kicked allows the 4 wheels to open automatically and you are ready to Roll!!!.....

Again when needed, by pressing the same button the wheels are easily retracted at the initial position housed inside the sole.

The button has 2 positions. The “lock” position (the engraved arrow towards right) where it locks the wheels in the rolling or walking mode, and a release / retract position (engraved arrow towards upward vertical position) .When in lock position the button cannot and should NOT be pushed i.e. the wheels cannot be opened or closed .The button should never be kicked or pushed when in locked position but only in vertical position.

Inside the box there is a removable stopper that can be very easily attached or removed if needed.

So the big added advantage of the amazing kick rollers is that when you don't want to skate you will won't have to carry them around on your back , you simply use them as trainer shoes .

YOU CAN EASILY WALK, RUN OR ROLL WHENEVER YOU WANT WITH ONLY THESE PAIR OF ROLLER SHOES.
